Abstract— We have investigated the use of “Magnetic currents” a strange phenomenon discovered 70 years ago that was supposedly used to help manufacture the most recent megalithic structure in the world located in Homestead, FL known as Coral Castle by Ed Leedskalnin. Magnetic currents are apparently another form of energy flow which is commonly known as magnetic flux. Magnetic flux is used transfer energy within a core of transformers for stepping up or stepping down voltage. However, we will expand the use of magnetic flux into the form of a “magnetic current” and show that it has some exciting applications that affect not only electromagnetism but gravity as well. We will compare magnetic currents with electric currents as well as show how momentum is conserved.
